2 October 2008

Subject: IODE Letter of support to tender No MARE/2008/03 "Preparatory actions for European Marine Observation and Data Network" for the 'chemical lot' as published in the Official Journal of the European Union S/124 of 28.06.2008 (ref. 2008/S 124-165113).

To whom it may concern

On behalf of the IOC Committee on International Oceanographic Data and Information Exchange (IODE) it is my pleasure to support this Tender (coordinated by Istituto Nazionale di Oceanografia e di Geofisica Sperimentale - OGS, established in Trieste, Borgo Grotta Gigante 42/c - 34010 Sgonico (TS) - Italy).

The EMODNET chemical lot is an important initiative that - if approved - will complement, reinforce and link to, the IODE OceanDataPortal global distributed data network as well as the IODE network of data centres in general. We therefore wish to extend our support to this proposal and look forward to collaboration between IODE and EMODNET chemical lot.

**ANNEX 2 TO THE CALL FOR TENDERS MARE/2008/03
"PREPARATORY ACTIONS FOR EUROPEAN MARINE OBSERVATION AND DATA NETWORK"**

LOT NO: 3 – CHEMICAL DATA

TECHNICAL TENDER FORM

Company name Istituto Nazionale di Oceanografia e di Geofisica Sperimentale - OGS	Telephone +39 040 2140391
Address Borgo Grotta Gigante 42/C, 34010 Sgonico-Trieste (ITALY)	e-mail agiorgetti@ogs.trieste.it

The technical offer must contain the following elements:

1. Understanding of objectives.

The European Commission, represented for the purposes of this call for tenders by the Directorate-General for Maritime Affairs and Fisheries (DG MARE), wishes to conclude service contracts for creating pilot components of the European Marine Observation and Data Network. The overall objective is to create a pilot to migrate fragmented and inaccessible chemical data into interoperable, continuous and publicly available data streams for complete maritime basins.

The results will help to define processes, best technology and approximate costs of a final operational European Marine Observation and Data Network. It will also provide the first components for a final system which will in themselves be useful to the marine science community.

The call for tenders comprises 4 lots. This bid concerns the lot 3: chemical data.

The specific objectives of the project are to:

- collate existing data from public and private organisations relating to the state of maritime basins; processing them into interoperable formats which includes agreed standards, common baselines or reference conditions;
- assessing their accuracy and precision and assembling them into common datasets;
- develop, test, operate and maintain a portal allowing public access and viewing of these data and a link to WISE-marine
- monitor and report on the effectiveness of the system in meeting the needs of users in terms of ease of use, quality of information and fitness for purpose of the products delivered;
- analyse what further steps need to be taken to improve the accuracy, precision, coverage and ease of use of the data, including a scheme for sustainable quality assurance and control of the data delivered to the system, both in this preparatory action and in the future larger system.

- analyse the necessary requirements to maintain the components built up in each lot as a sustainable infrastructure
- keep the portal operational afterwards and be prepared to transfer to the Commission.

The Call asks for the groups of chemicals required for monitoring the Marine Strategy Directive:

1. synthetic compounds (e.g. priority substances under Directive 2000/60/EC that are relevant for the marine environment), i.e.
 - a) pesticides,
 - b) antifoulants,
 - c) pharmaceuticals,
2. heavy metals,
3. radionuclides;
4. fertilisers and other nitrogen- and phosphorus-rich substances
5. organic matter (e.g. from sewers or mariculture)
6. hydrocarbons including oil pollution

At least one chemical should be defined for each of these 8 groups to make a minimum of 12 chemicals in all. The same chemicals should be used for all maritime basins. They should be chosen on a basis of their threat to the environment. It may be that the chemicals themselves are not monitored but rather indicators for these chemicals.

The data should include:

- all measurement points including inputs (from rivers, coastal activities, atmospheric deposition and ships) and concentrations (in sediments, water columns and biota - especially biota meant for human consumption where there is a risk to human or environmental health). For biota, the matrix (for example, type of mussel, fish or tissue) should be indicated.
- aggregations at an appropriate level that allows seasonal or annual trends to be observed.
- contiguous data. Those derived from sightings of short-lived events (e.g. oil spills) should be normalised to take account of the observation frequency (e.g. average number of events per month per square nautical mile).
- indications whether guidelines (e.g. by OSPAR) have been followed in making measurements. Both the original observations (or indicators for some of these chemicals) and harmonised maps should be accessible.

The chemical data should concern the following geographical regions:

- the Greater North Sea, including the Kattegat, and the English Channel. It includes stretches of water (Fair Isle, Cromarty, Forth, Forties, Dover, Wight, Portland) identified in a recent study¹⁵ as being those European waters most affected by human activity.
- the Black Sea.

The portal must be developed with the main purpose to allow the download of data for further analysis by users and to make it available for combination with data from other portals including the other portals developed in this preparatory action. The portal will also allow the maritime community and potential users to understand how the data was collected as well as the overall aims of the EMODNET project. Thus the portal should allow:

- a. On-line instructions.
- b. Viewing a catalogue of the data available. The catalogue shall be structured in line with best practices relevant to the field of science covered by the data.

- c. Querying of data. The description of the data shall as much as possible employ the INSPIRE metadata implementing rule while downloading should be based on the INSPIRE download service implementing rule or should it not be available, on the OGC Web Feature and Coverage Services Specifications.
- d. On-line capability to view the position and magnitude of data as well as geographical information system layers delivered in accordance with the INSPIRE View Service Implementation Rule. This should include an online viewer allowing layer-selection, attribute queries, panning and zooming.
- e. Downloading of GIS layers, monitoring and contiguous data.
- f. Understanding of the precision of the data and how it has been processed.
- g. Users to receive feedback on queries sent by e-mail.
- h. Links to other relevant web-sites (on measurements, standards, similar projects etc).

2. Added value.

This EMODNET Chemical joint tender has been prepared and submitted by the **SeaDataNet** consortium, represented by a large subgroup of the partnership, selected on their geographical coverage and specific expertise, relevant for the pilot of the EMODNET chemical lot.

SeaDataNet is a leading infrastructure in Europe for marine & ocean data management. It is actively operating and further developing a Pan-European infrastructure for managing, indexing and providing access to ocean and marine data sets and data products, acquired via research cruises and other observational activities, in situ and remote sensing. The basis of SeaDataNet is interconnecting 40 National Oceanographic Data Centres and Marine Data Centers from 35 countries around European seas into a distributed network of data resources with common standards for metadata, vocabularies, data transport formats, quality control methods and flags, and access. Thus most of the NODC's operate and/or are developing national networks to other institutes in their countries to ensure national coverage and long-term stewardship of available data sets.

The majority of data managed by SeaDataNet partners concerns physical oceanography, marine chemistry, hydrography, and a substantial volume of geology, geophysics and marine biology. These are partly owned by the partner institutes themselves and for a major part also owned by other organizations from their countries.

SeaDataNet is implemented as an EU Research Infrastructures I3 project, which was awarded in the FP6 programme, began in early 2006 and has a duration of 5 years. Version 1 of its infrastructure upgrade was launched in April 2008 and is now rolled out to all 40 data centres. It comprises the network of 40 interconnected data centres (NODCs) and a central SeaDataNet portal. V1 provides users a unified and transparent overview of the metadata and controlled access to the large collections of data sets, that are managed at these data centres.

The SeaDataNet V1 infrastructure comprises the following middleware services:

- Discovery services = Metadata directories and User interfaces
- Vocabulary services = Common vocabularies and Governance
- Security services = Authentication, Authorization & Accounting
- Delivery services = Requesting and Downloading of data sets
- Viewing services = Mapping of metadata
- Monitoring services = Statistics on system usage and performance and Registration of data requests and transactions

- Maintenance services = Entry and updating of metadata by data centres

In the coming years the SeaDataNet infrastructure will be extended into Version 2 with a further development of:

- Viewing services = Quick views and Visualisation of data and data products
- Product services = Generic and standard products

As a basis for the V1 services, common standards have been defined for metadata and data formats, common vocabularies, quality flags, and quality control methods, based on international standards, such as ISO 19115, OGC, NetCDF (CF), ODV, best practices from IOC and ICES, and following INSPIRE developments.

Also an architecture has been designed to provide a coherent system of the various V1 services and a later extension with V2 services. For the implementation, a range of technical components have been defined and developed. These make use of recent web technologies, and also comprise Java components, to provide multi-platform support and syntactic interoperability. To facilitate sharing of resources and interoperability, SeaDataNet has adopted the technology of SOAP Web services for various communication tasks.

Considering this situation it is proposed to realize the EMODNET Chemical portal by using the SeaDataNet network of national data centres and its new V1 infrastructure, thereby demonstrating its abilities for handling and giving users access to the requested chemical data sets and products in combination with other multi-disciplinary data sets.

This approach and synergy will have mutual benefits for the EMODNET chemical pilot and for SeaDataNet:

- It guarantees an easy expansion of the geographical coverage of the EMODNET chemical data sets to other seas, because SeaDataNet Data Centres are located and established in all countries riparian to the European seas;
- It guarantees an easy expansion and merging with other types of marine data sets, because SeaDataNet already handles a large volume of multi-disciplinary data sets and other initiatives are planned and underway for enlarging the SeaDataNet coverage by connecting to other networks, such as the biological community via EurOBIS and MarBEF and the geological & geophysical community via upgrading and integrating of EU-SEASED and SEISCAN;
- It facilitates a long term sustainability of the infrastructure, because the infrastructure and network are based upon the NODC's, which are usually part of large marine research institutes and which receive long term funding from their institutes for managing and safeguarding marine data sets. The infrastructure and consortium are not just created for the EMODNET tender and might fall apart, once the EU funding halts. SeaDataNet is in a position to continue its services, especially when there is a perspective for a wider implementation of EMODNET;
- It challenges SeaDataNet to prove its concept, network and infrastructure, which implicates that the EMODNET pilot will be developed by a dedicated and motivated team;
- It guarantees that high quality and long expertise with handling marine data will be mobilised for handling and processing the EMODNET chemical data sets;
- It makes optimal use of existing infrastructure and ongoing SeaDataNet developments, - the time lines are in parallel, which provides excellent opportunities for synergy,

- whereby the EMODNET tender will give an extra stimulus to the development of the V2 data products viewing and presentation services;
- It will provide excellent efficiency and cost effectiveness by combining efforts and developments, not only technically, but also organisation-wise. There is no need to create any specific new database for these data, because the SeaDataNet decentralised scheme of databases is in place for managing the chemical data sets, and the discovery and access services will be implemented by using the SeaDataNet Common Data Index (CDI) system (based upon ISO 19115). The network of national partners and their national networks will be mobilised to collect, process, manage and give access to the collated data sets and products;
- The existing SeaDataNet expertise in data processing, statistical analyses and quality control as well as in generating aggregated data products will be used and further developed as part of the EMODNET pilot.
- Other data providers will be more willing to contribute and to continue contributing data sets to the EMODNET pilot, because it is undertaken by familiar data centres with a long term perspective and objectives and not by an occasional ad-hoc consortium. The latter is even more true, because many of the SeaDataNet partners are also the prime data centres for national monitoring data in their countries.

3. Coverage of data and access restrictions

The Data Centres in the SeaDataNet network already manage a large volume of relevant data sets that will be brought to the EMODNET pilot. In addition, the SeaDataNet partners have contacted a number of data holders in their country with relevant data sets, that will be collated as part of the EMODNET activities, and that will enlarge the available data collections. Moreover the SeaDataNet partnership includes ICES, which acts as data centre for monitoring data for OSPAR, HELCOM and EIONET, and that will bring in this volume of data sets.

The EMODNET Chemical tender asks for data sets from the Greater North Sea and the Black Sea region. However in view of a later expansion to all European Seas and to explore the methods for achieving an overall consistent quality of data sets and products, the SeaDataNet consortium has decided to expand the pilot regions with some spots from the Mediterranean: Balearic Sea, Gulf of Lion, North Adriatic Sea, Gulf of Athens and NE Levantine basin.

The detailed overview of already known relevant data sets and sources for each of the 3 geographical regions, Greater North Sea, Black Sea and 5 spots in the Mediterranean, is described in the Data Inventory annex. As part of the collation activities even more relevant data sets and sources might come forward.

The Tender requires that at least one chemical should be defined for each of these 8 groups to make a minimum of 12 chemicals in all and that the same chemicals should be used for all maritime basins. They should be chosen on a basis of their threat to the environment.

Considering the Data Inventory and the OSPAR Quality Status Report 2000 the partnership has decided to focus on the following chemicals:

1. synthetic compounds (dichlorodiphenyldichloroethane (DDE), Dieldrine, DDT, polychlorinated biphenyls (PCBs), hexachlorobenzene (HCB), tributyltin (TBT))

2. heavy metals (Barium, Cadmium, (Cd) Mercury (Hg), Lead (Pb), Copper (Cu), Zinc (Zn), Nickel)
3. radionuclides (cesium-137, cesium-134, cerium-144, tritium (3H), radium-226, lead-210, polonium-210, uranium-238, cobalt-60, strontium-90, potassium-40)
4. fertilisers and N- and P-rich substances (NO₃-N, NO₂-N, PO₄-P, Total P, Total N)
5. organic matter (total organic carbon)
6. hydrocarbons (polycyclic aromatic hydrocarbons (PAHs))

The present data-inventory demonstrates a very good coverage of available data, which will offer quite sufficient critical mass for the EMODNET pilot and for developing qualitative good data products. For the latter use will be made of sophisticated software tools, Ocean Data View (ODV) and Data Interpolating Variational Analysis (DIVA), that have proven track records for QC/QA and statistical processing and that are part of the SeaDataNet infrastructure components. The Workplan will give more detail on these tools and their application in the project.

Data access:

The metadata and aggregated data products (GIS layers) in the EMODNET pilot will be public domain and freely available for all users. However for data access (= downloading) the SeaDataNet consortium and thus the EMODNET pilot must respect the data copyrights of owners, in particular for the background data as detailed in the data inventory. This fact is also one of the draft outcomes of the Legal Study that was recently commissioned by the EU in preparation of EMODNET. But the possible problem of various data access restrictions is solved by the SeaDataNet V1 infrastructure, by including in its metadata a value for data access restriction for every data set it manages. This value is derived from a SeaDataNet Common Vocabulary (L081), that ensures standardisation. It varies from ‘unrestricted’ to ‘restricted’ with a number of values in between. Firstly, this label gives users clear and well defined information about the possible data access restrictions. (Note: Most of the data sets in SeaDataNet and the EMODNET pilot will be ‘unrestricted’).

Secondly SeaDataNet and thus the EMODNET pilot will require users to register once to a Central User Register, that will give the id-password for data access and delivery services. By registering, the users will agree implicitly with the SeaDataNet Data Policy and its user licence agreement. The SeaDataNet data policy is consistent with, and in the spirit of, national and international policies and laws. Applicable policies or laws are those related to UN conventions, policies of international bodies often within the UN, policies and laws of the European Union. The SeaDataNet data policy is intended to be fully compatible with the Directive of the European Parliament and of the Council on public access to environmental information, the INSPIRE Directive, IOC, ICES, WMO, GCOS, GEOSS and CLIVAR data principles.

The SeaDataNet Licence Agreement has the following terms:

1. The Lessor grants to the Licensee a non-exclusive and non-transferable licence to retrieve and use data sets and products from the SeaDataNet service in accordance with this licence.
2. Retrieval, by electronic download, and the use of Data Sets is free of charge, unless otherwise stipulated.
3. Regardless of whether the data are quality controlled or not, SeaDataNet and the data source do not accept any liability for the correctness and/or appropriate interpretation of

the data. Interpretation should follow scientific rules and is always the user's responsibility. Correct and appropriate data interpretation is solely the responsibility of data users.

4. Users must acknowledge data sources. It is not ethical to publish data without proper attribution or co-authorship. Any person making substantial use of data must communicate with the data source prior to publication, and should possibly consider the data source(s) for co-authorship of published results.
5. Data Users should not give to third parties any SeaDataNet data or product without prior consent from the source Data Centre.
6. Data Users must respect any and all restrictions on the use or reproduction of data. The use or reproduction of data for commercial purpose might require prior written permission from the data source.

Because these terms are in conformance to national and local licence agreements as in use by many data sources, it is encouraged that data sources in the EMODNET pilot will adopt the 'SeaDataNet licence' data access restriction as appropriate also for their data (in case these are not 'unrestricted' as preferred and encouraged by SeaDataNet). In practice this will then imply that a registered SeaDataNet user, having accepted the overall SeaDataNet licence agreement, can thus get access to the data sets via SeaDataNet automatically, without any problems, via the V1 services. Of course, the user must respect the licence terms (see above).

4. Methodology + time/work schedule.

The EMODNET Chemical project is undertaken by a European network of 26 partners from 18 coastal countries, comprising 22 data centres, 1 international organisation ICES and 3 institutes, that bring in additional expertise in informatics and data product development. Geographically the Greater North Sea, the Black Sea and spots in the Mediterranean are covered.

Participant Number *	Participant organisation name	Country
1 (project coordinator)	Istituto Nazionale di Oceanografia e di Geofisica Sperimentale (OGS)	Italy
2 (technical coordinator)	Mariene Informatie Service 'MARIS' BV (MARIS)	Netherlands

25	University of Cyprus-Oceanography Centre (OC-UCY)	Cyprus

In addition, support will be given by UNESCO IOC-IODE (see included Letter of Support).

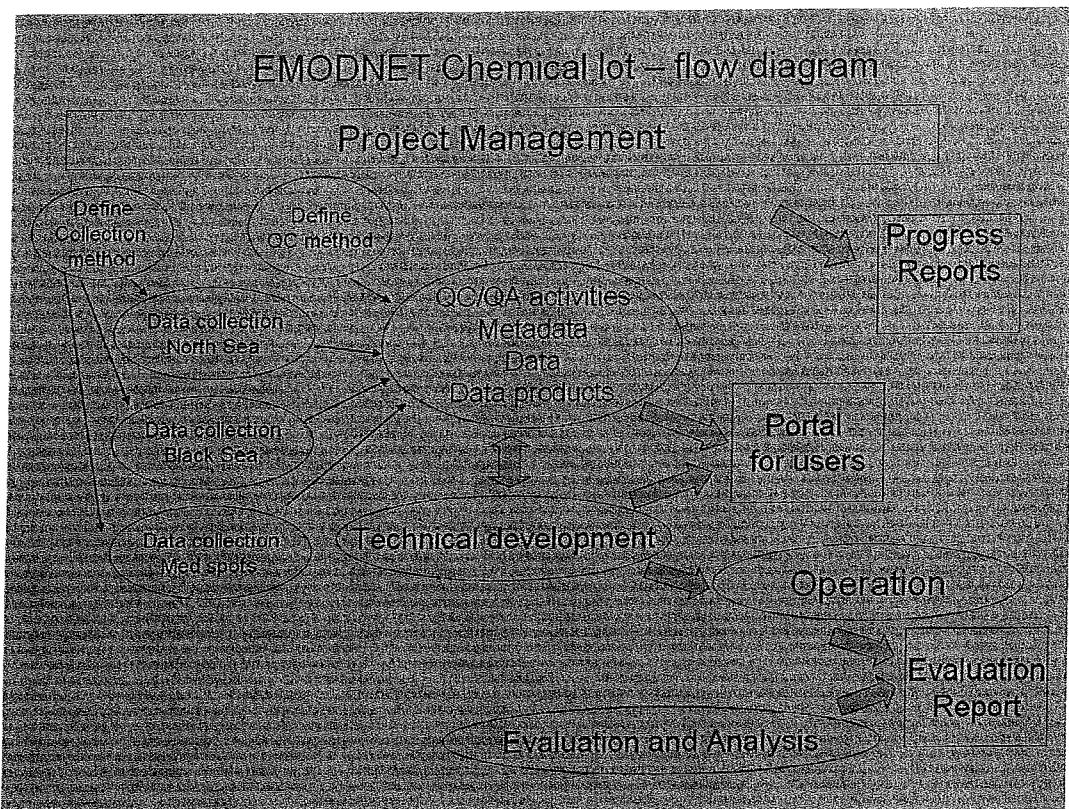

Details about the qualifications of the partners and their key persons can be found in the Annex.

Workplan:

To achieve the objectives of the EMODNET Chemical pilot the work plan is divided in the following Work Packages (WP):

WP1	Project management
WP2	Data collection and metadata compilation
WP3	QC/QA and products
WP4	Technical development and operation
WP5	Analysis and evaluation

The work flow is illustrated in the following diagram:

The project is executed in 4 Phases:

- Phase 1 - Months 1-12 - Development and build
- Phase 2 - Months 13-18 - Test and monitor
- Phase 3 - Months 19-24 - Upgrade
- Phase 4 - Months 25-36 - Maintenance and operation

The planning of activities is given in the following planning diagram:

The Work packages are detailed in the following pages:

Work package number	WP1								
Work package title	Project Management								
Participant number	1	2	3	4	5	6	7	8	9
Participant short name	OGS	MARIS	NERC-BODC	IFREMER	BSH-DOD	IMR	NERI-MAR	VLIZ	RBINS-MUMM

Objectives

- To manage and to coordinate all project activities, ensuring timely delivery and high quality of results and products

Description of work:

The overall project management activities include:

- preparation and organization of Partner Group meetings
- preparation and organization of Coordination Group meetings
- preparation of minutes and action lists of the meetings
- coordination of agreed actions and deliverables
- monitoring progress and possible revised planning of activities
- financial administration
- preparation of 2-monthly concise progress reports to be posted on the project web-site indicating meetings held, difficulties encountered, inventories of data made available, through phases 1 to 3
- preparation and submissions of management reports and progress reports for each phase, including invoices, to the EC.

The project organisation consists of the following elements:

- Project coordinator
- Technical coordinator
- Coordination Group, consisting of leaders of each Work Package (OGS, MARIS, NERC-BODC, NERI-MAR, ICES and IFREMER as SeaDataNet coordinator)
- Partners

The Project Management activities will be performed by the Project Coordinator and Technical Coordinator, supported by the Coordination Group members. Project management is a continuous activity during the full project period of 36 months.

The Project and Technical coordinators will meet with the Commission in Brussels for:

- A kick-off meeting at the beginning of the project with representatives of all lots,
- A meeting at the end of the first phase to present the first interim report, review progress,

- present the operational portal and exchange experience between different lots of the project,
3. A meeting after the end of the second phase to present the second interim report,
 4. A meeting two months before the end of the third phase to coincide with the release of the final prototype product and draft final report.

Task lead by OGS

Deliverables :

- bimonthly progress reports to be posted on the project web-site indicating meetings held, difficulties encountered, inventories of data made available. These start at month 2 and continue through phases 1 to 3
- a first interim report after phase 2
- a second interim report after phase 3
- a draft final report to be presented 2 months before the end of phase 4
- a final report at the end of phase 4 indicating:
 - what was done in the project
 - challenges faced
 - analysis of performance and lessons learned
 - analysis of sustainability
 - maintenance report at the end of phase 4
 - 15-page executive summary that can be read by a non-specialist

Objectives

- To gather all identified chemical data sets into the NODC databases
- To compile metadata for all chemical data sets in CDI format

Description of work:

Right after the start the partners will discuss and formulate an effective method for gathering and preparing the data sets from the data centres and identified other data sources, including related documentation. The V1 standards of SeaDataNet will be adopted and where needed, extended for:

- Metadata: the Common Data Index (CDI) metadata profile has been defined, based on ISO 19115
- Data formats: for profiles, time series and trajectories the SeaDataNet ODV ASCII data format has been defined as the SeaDataNet output format and directly suited for import into the ODV and DIVA software
- Common vocabularies, governed by an international board and provided as Web services, for describing parameters, platforms, instruments, etc

Adopting the CDI metadataformat and tools:

The Common Data Index (CDI) is the central discovery service in SeaDataNet enabling users to have a detailed insight of the availability and geographical extent of marine data, archived at the connected data centres. It gives the description of individual data sets and measurements with key fields (what, where, when, how, who etc.). It also provides the linking pin from the discovery services towards the delivery services, because it is directly related to the data sets, to which the users can request access. Users can freely search and browse the CDI discovery services and identify relevant data sets. The CDI User Interface includes a shopping basket and transaction processing mechanism, by which users can request access to selected data sets. Access is given as downloading services, whereby the data sets can be downloaded by users from the data centres in the SeaDataNet ODV ASCII data exchange formats.

Considerable work has been undertaken, first in Sea-Search and later in its successor SeaDataNet, to define the CDI metadata format (xml) and XML schema (xsd) as an extended profile of the ISO 19115 standard for geographical data sets. The latest version makes use of standard mark-up terms, wherever possible, which are managed in the Common Vocabularies, while for Organisation information, standard references are included to the EDMO – European Directory of Marine Organisations. Furthermore tools and services have been developed for generating CDI XML records from the data management systems of data centres, a CDI XML validation Web service, parsing the CDI XML records against an extended CDI schema including vocabularies support, and tools for

importing CDI records into the central SeaDataNet CDI Directory and its Portal User Interface. The latter includes a combined alphanumeric – geographical interface.

Adopting and extending the SeaDataNet Common Vocabularies:

The SeaDataNet Vocabulary Web services have been set-up to provide ‘controlled vocabularies’, which are used to mark up the CDI metadata and to label data. These common vocabularies provide access to lists of standardised terms that cover a broad spectrum of disciplines of relevance to the oceanographic and wider community. Using standardised sets of terms solves the problem of ambiguities associated with data markup and also enables records to be interpreted by computers.

Content governance of these vocabularies is very important to stay up-to-date and synchronised with ongoing developments. Therefore a combined SeaDataNet and MarineXML Vocabulary Content Governance Group (SeaVoX) has been set up, moderated by NERC (BODC), and with active membership from experts from SeaDataNet, MMI, MOTIIVE, JCOMMOPS and further international groups. SeaVox operates by mailing list server.

The common vocabularies comprise various lists, such as related to variables, but also other relevant topics, such as sea area names, platform classes, instrument types, and so on. Already the vocabularies comprise various terms from the chemical domain, but these have to be validated and where needed, extended for the EMODNET Chemical pilot. In practice this will be done by proposing additions or modifications to the international SeaVox governance group, that will respond quickly by accepting or denying proposed items. If accepted, these terms will be added to the operational vocabularies via the moderator NERC (BODC).

Adopt the SeaDataNet standards for transport of chemical data

The access to data sets in SeaDataNet V1 and the EMODNET pilot is restricted to downloading services. Users are able to download selected data sets in a common exchange format. For the chemical data the standard ODV ASCII data format will be adopted. A JavaTool (NEMO) is available to support other data centres in a local conversion from their in-house formats to the ODV ASCII format.

A guideline document will be prepared, including these standards and available tools, that will be applied for preparing all data sets in the EMODNET chemical pilot and for facilitating the process of gathering and organising data sets from other data sources into the SeaDataNet infrastructure.

Using the guideline and tools all relevant data sets at the data centres will be prepared and described with CDI metadata, where still needed. Moreover identified data sets from other data sources will be gathered, loaded into the SeaDataNet NODC databases and described with CDI metadata.

The CDI population and maintenance will include sub-activities:

- Analysis of the formats and local availability of metadata at partners
- Mapping and local editing activities
- Compiling and validating a first test batch of metadata
- Compilation and/or updating of the metadata by the data centres and validation
- Importing into the central CDI directory

These activities will take place in Phase 1 of the project and will provide the data sets, that together form the pilot collection.

Taskleader Greater North Sea area: NERI-MAR

Taskleader Black Sea: MHI

Taskleader Mediterranean spots: NCMR
Overall Taskleader: NERI-MAR

Deliverables :

- Guideline with standards for metadata, data format, and vocabularies and procedure for gathering data sets
- Data sets from data centres available in standard formats and included in CDI
- Data sets from other data centres gathered and loaded into the SeaDataNet infrastructure in standard data format and included in CDI

Objectives

- To define a standard QC and QA method
- To validate and to harmonise the quality of all chemical data sets
- To generate integrated and high quality map products for selected parameters
- To generate indicators about accuracy and reliability

Description of work:

The chemical data are very diverse in terms of data type, analytical methodology and quality. Spatial and temporal coverage of the chemical data tend to be very inhomogeneous, and in cases of time series, it is common that sampling and measurement techniques have been frequently modified over time. These complications make it necessary to apply rigid quality control procedures before the data are released to the public and are used to produce scientific products, such as distribution maps or temporal evolution plots.

Partner ICES will lead the way in defining the Quality Control procedures, that will be applied in the project to screen and to validate all the gathered chemical data sets from WP2 by the NODC's.

Robust and effective quality assurance routines must be applied to all data sets, to identify data inconsistencies and outliers out of expected ranges. This will be undertaken in accordance with the standard practices and procedures utilised within ICES for data collected on behalf of OSPAR and HELCOM - as much of this data is - also relevant to Marine indicators work with the EEA, it also applies there.

The ICES experience is especially triggered to chemical data sets for ICES, OSPAR and HELCOM sea regions. The Mediterranean Sea and Black Sea communities have considerable experience with joint QC/QA activities through the MEDAR/MEDATLAS Projects, in which the ICES Hydrographer was involved as advisor. (see e.g. <http://www.ifremer.fr/medar/quality.htm>). Therefore extra attention will be given in the preparatory phase to defining a balanced approach for the different geographical areas, taking into account the ICES and the MEDAR/MEDATLAS experiences.

There are Conventions for each of the geographical regions (HELCOM, OSPAR, MAP and the Commission on the protection of the Black Sea against Pollution), joined by the Member States, which are involved and experienced in regional assessments. For the EMODNET pilot it can be very useful to consult with the Conventions during the pilot, e.g. for products definition, also because the EMODNET Chemical portal has the potential to become an important instrument for the work of the

Conventions. Therefore it is suggested to the EU to initiate such a cooperation.

Guideline with methodology and software:

A guideline will be prepared with the prescribed methodology for quality control and quality flags to be used. This will be the result of the analysis described above, combining the ICES and MEDAR/MEDATLAS experiences.

The data centres will use software packages for the Quality Control of all the collected data sets. Many data centers already have their in-house software, that will be configured according to the agreed methodology and quality flag scale. E.g. in the Mediterranean Sea and Black Sea communities many make use and are very familiar with the MEDATLAS QC software tools. As an alternative partners can adopt the latest version of the Ocean Data View software (ODV; <http://odv.awi.de>).

Ocean Data View (ODV) is a software package for the interactive exploration, analysis and visualization of oceanographic and other geo-referenced profile or sequence data, that is available for all major computer platforms and currently has more than 10,000 registered users. ODV has a very rich set of interactive capabilities and a very wide range of supported plot types. This makes ODV ideal for visual and automated quality control. The latest release, ODV4, developed as part of SeaDataNet, overcomes many limitations of previous versions and now supports more flexible metadata models, an unlimited number of variables and custom quality flag schemes, and is fit for loading data sets in the SeaDataNet ODV ASCII format.

A training course will be organized to train data centre personal to apply the common QC methods and software tools efficiently for visual and automated data quality control as well as quality flagging. In addition, also the latest version of the DIVA/ODV software package will be provided that allows facilitated usage of advanced gridding methods for production of a great variety of data plot types. Heterogeneously distributed datasets, such as the ones covered in the EMODNET chemical pilot, pose special problems to gridding algorithms. Support will be given to data centres to ensure proper usage of these methods.

Quality Control and Quality Assurance:

After this preparatory phase all NODC's will validate their data sets in the standard procedure, using the common tools. This is essential to ensure high quality, and harmonized data sets.

But the overall quality of this distributed QC must also be assured. Therefore it is planned that the QC processed data sets will be forwarded to ICES for additional Quality Assurance. ICES will load the received data in one of the ICES Databases, where the consistency of the data will be checked. The fundamental chemical parameter data are exchanged with the WDC for Oceanography (USA) for comparison and checking against their data and checking routines, this acts as an external check on data coming into ICES.

Furthermore it is considered to seek assistance of the ICES assessment working groups. These working groups have defined guidelines and quality criteria specified for OSPAR/HELCOM assessments and they analyse all relevant data held in the ICES Data Centre that relate to the assessment. The data is filtered and ranked according to specific quality criteria, for example the chemical measurements that originate from national laboratories that pass the QUASIMEME intercalibration exercise (external assessment of the quality of the laboratories ability to accurately measure chemical parameters in the marine environment) are given a higher ranking. As an example in the OSPAR MON assessment no data would be excluded, but data of good quality would be weighted more strongly (weight 1,0) than data with poor or absent QA information (weight 0,2).

Afterwards the NODC's will be informed of the assessment results and which data failed to be included in the assessment. This will result in improving the quality of the local databases at the NODC's and thus the overall quality of the EMODNET chemical pilot database. Feedback will be provided to the original data owner/supplier and any problems with the data will be discussed, resolved and/or documented as appropriate. This information will be stored alongside the data as part of the data documentation.

Data products:

An important objective of the EMODNET Chemical pilot is to prepare integrated data products by means of maps, that can be provided to users via viewing services to illustrate variability in space and time and trends in time of the given chemical parameters. Preparing these maps, which can be delivered as GIS layers or via WMS services, requires interpolation of available data sets.

In practice, the in-situ measurements of chemical data are often sparse and heterogeneously distributed. The DIVA software tool (Data-Interpolating Variational Analysis) allows to spatially interpolate (or analyse) those observations on a regular grid in an optimal way. The analysis is performed on a finite element grid allowing for a spatial variable resolution and a good representation of the coastline and isobaths. As some areas covered in this project have complex coastlines, the finite-element grid of DIVA will be able to adequately resolve those.

The signal-to-noise ratio and correlation length are crucial parameters describing the covariance function. They can be estimated by computing an empiric covariance function from the observations or by generalized cross-validation. The covariance function used for the analysis takes the topography into account and avoids spurious propagation of information across islands. The more realistic the covariance function is, the more accurate the analysis will be. This is particularly useful for datasets with low spatial coverage as the variables considered in this tender.

It is also possible to compute error maps for the gridded fields which reflect the accuracy of the observations and their distribution. This allows to asses the reliability of the gridded fields and to objectively identify areas with poor coverage. In an approach similar to the generalized cross-validation, the value of the gridded fields without taking a particular observation into account can also be computed. By comparing this analysed value with the observations, one can establish how consistent one particular observation is with the remaining dataset. This information can be used by the data centres to identify bad data.

This method has been integrated into ODV, and the integration greatly facilitates the usage of DIVA. Features supported by the ODV/DIVA integration include proper treatment of domain separation due to land masses and undersea ridges or seamounts and the realistic estimation of water mass properties on both sides of the divides. This is important in areas, such as the Kattegat, with many islands separated by narrow channels.

The DIVA software can also load the data sets, prepared via the MEDATLAS QC software and other in-house QC systems. The command line interface of DIVA allows for batch processing of large data sets.

The DIVA software is thus an important tool next to MEDATLAS QC, ODV and other in-house QC software for the Quality Control process and moreover for preparing integrated maps for selected parameters. Using DIVA will be included in the initial training.

The actual production of integrated maps for the selected geographic regions will be undertaken, once all data sets have undergone QC and QA. Data sets from all data centres will be retrieved via the SeaDataNet infrastructure and aggregated into pools of data for specific parameters, that are loaded into ODV/DIVA for expert interpolation and visualization, resulting in high quality maps. These maps will be transferred to a GIS environment.

Note: ICES is already producing products for OSPAR and HELCOM. It can be a valuable exercise to generate some of these also with the new EMODNET chemical data.

The maps will also be suited to exchange with other initiatives, e.g. via the WMS services:

- for the prototype European Atlas of the Seas
- to support the broad-scale European Marine Habitats map
- for the pilot project for Environmental Monitoring in Black Sea
- for environmental reporting in WISE-Marine

Taskleader: ICES

Deliverables :

- Guideline with standard procedure and tools for QC/QA of chemical data sets in the European sea regions
- All chemical data sets processed and quality controlled in the NODC databases
- Gridded fields of selected parameters representing climatological averages
- Error maps to reflect the accuracy and the distribution of the observations

Objectives

- To develop and launch the EMODNET portal and services
- To keep the website and services operational, including monitoring

Description of work:

A dedicated website and portal will be developed for the EMODNET Chemical portal. The website gives background and progress information about the project and is maintained via an online Content Management System. It will also give information on the QC/QA procedures, formats and involved partners.

One of the core services of the EMODNET Chemical portal is the Common Data Index (CDI) User Interface including its services for accessing and downloading data sets. This can be realised virtually with its own look & feel and chemicals subset, while it is driven by the underlying central SeaDataNet Common Data Index database, interface and infrastructure of connected data centres.

The effect will be that users can search and retrieve data sets via the dedicated EMODNET Chemical portal, but also in a wider data context via the SeaDataNet portal.

Further core services of the EMODNET Chemical portal are the catalogue and viewing services for the integrated maps of selected parameters. This is implemented by adopting the product catalogue services as developed earlier within the framework of MERSEA and recently updated within ECOOP. The catalogue gives an ISO 19115 metadata description for each standard product, including instances of products (each month, season, at different vertical depths, etc.). The metadata relate to the actual maps that can be retrieved and viewed via WMS services (OGC). The maps can be enriched by a layer of the actual observations, as included in the CDI directory. Clicking on observations leads to CDI details and thus to options for requesting access to the underlying data set.

These technical developments can be combined with comparable planned activities for SeaDataNet V2, which again gives crossfertilization and a cost effective approach, in particular for the EMODNET Chemical pilot. It also makes these functionalities feasible in the limited timeframe of the EMODNET building phase.

The EMODNET website is launched within 2 months after the project start and also will include an extranet for project documentation. The EMODNET core services are launched, once the data sets have been fully processed and the data products have been prepared. This is planned in Month 12, to

conclude the Phase 1 of the project.

Thereafter the website and services are kept operational and monitoring data are collected via general web statistics (e.g. via the Open Source software for web statistics AW Stats) and via the actual user transactions, that are registered in the portal via its Request Status Manager (RSM) module. This gives useful information about users, data centres, data requests (what and when). That information gives input to WP5 Analysis and Evaluation.

Input is expected from the meeting with the other portals (biological, geological and hydrographic), and WISE-MARINE, which seek for interlinking and tuning functionalities. These upgrades will be undertaken in Phase 3, if feasible and not beyond budget, and added to the portal.

Then, in Phase 4, the website and core services will run operationally for another 12 months, thereby collecting more user feedback. It is expected that the user feedback from WP5 in this phase will generate requests for additional useful and extra functionalities or upgrades of existing features of the portal. These requests will be collected for the analysis report. Selected upgrades will be undertaken in Phase 4, if feasible, not beyond budget and really giving added-value.

Taskleader: MARIS

Deliverables :

- Dedicated website with project information, maintained by CMS
- EMODNET CDI Core service for discovery and delivery of chemical data sets
- EMODNET Products Core service for discovery of maps and viewing of maps via WMS
- EMODNET metadata integrated into the SeaDataNet portal to serve extra users and to merge with other multi-disciplinary data sets
- Upgraded services
- Monitoring data about visits and usage

Objectives

- To report on the effectiveness of the system in meeting the needs of users
- To analyse what further steps need to be taken for improvement, expansion and sustainability

Description of work:

The portal will run in pre-operational mode in Phase 2 and in full operational mode for at least 6 months in Phase 4. During this time statistics will be collected (number of hits, amount and type of data used, purpose for which it is intended). During phase 4 users will be questioned about their experiences and their assessment of ease-of-use and fitness for purpose of the data. A report on intensity of use as well as possible improvements relating to the ease of use of the portal will be submitted as part of the final report. All communications of users by e-mail to the portal will be logged and annexed to the report. Ease of use improvements will be implemented by the end of the contract, if feasible, not beyond budget and really giving added-value.

An analysis of the lessons learned during this project will be prepared, including analysis of:

- The main barriers to the provision of data by data holders – scientific (uncertainties in measuring or obtaining indicator for required parameters), institutional (willingness of bodies to share data), legal (rules limiting access to data), commercial (cost of data), information technology (formats, standards, information systems) and financial (effort required to prepare data). The contractor will suggest a plan outlining how to overcome those barriers.
- The challenges to rendering data interoperable including different measurement techniques, different baselines, different standards, different nomenclature etc. The contractor should indicate what steps that might be taken by data holders or the portal operator to improve interoperability.
- The challenges to producing contiguous data over a maritime basin from fragmented, inhomogeneous data and how to overcome these challenges.
- The fitness for purpose of the data for measuring ecosystem health of the maritime basin and what might be done to overcome any shortcomings.
- The priorities and effort required for improving the accuracy, precision and coverage of the data collated including a description of how an appropriate data quality assurance and control system can be established.
- The performance of the chosen portal technology in terms of speed of response, user-friendliness.

Finally a set of recommendations will be prepared as part of the final project report describing what

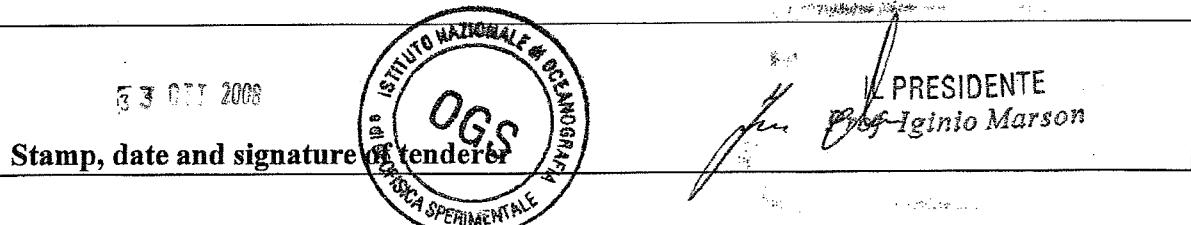

would be necessary for the overall EMODNET to remain as a sustained infrastructure. This will cover at least recommendations on:

- availability of standard procedures facilitating data flow,
- maintenance,
- the model for governance by actors in the system,
- the institutional setting,
- required resources including cost.

Taskleader: NERC-BODC

Deliverables :

- report on the effectiveness of the system in meeting the needs of users
- report on analysis of the lessons learned
- set of recommendations for sustainability of the infrastructure

PARAMETER GROUP (choose between SYNTHETIC compounds, Heavy metals, Hydrocarbons including oil pollution, Radionuclides, Fertilisers and other nitrogen- and phosphorus-rich substances, Organic matter)				Black Sea	
MATRIX (choose between Sediment, Water column, Biota)	Parameters (indicate unit of measure and precision)	National collator (= NODC)	Data Holding Organization	No of meas. (specify data volume)	Monitoring System (specify if data are part of a continuous monitoring programme)
Sediment	Heavy metals	Major and Minor elements	HCMR	39 stations with 1 or 2 samples per station)	Sept. 2002, Sept. 2004
Sediment	Radionuclides	Pb210	HCMR	2 sedimentation rates from 2 stations	Oct. 2007
Water column	Heavy metals	Geochemistry of Major-Minor elements	HCMR	39 stations (~ 100 samples)	Sept. 2002, Sept. 2004
Water column	Organic matter	Particulate Organic Matter	HCMR	Black Sea	Sept. 2002, Sept. 2004, Oct. 2007
Water column	Pesticides	DDT	RIHMI-WDC	500 Black Sea	1975-1986
Water column	Heavy metals	Pb, Cu, Fe, Zn	RIHMI-WDC	800 Black Sea	1975-1986
Water column	Hydrocarbons including oil pollution	Oil pollution	RIHMI-WDC	1200 Black Sea	1975-1986
Water column	Pesticides	DDT	RIHMI-WDC	Regularly sampled from the surface to 5 m depth	Eastern coast of Black Sea 2001-2007
Water column	Heavy metals	Pb, Cu, Fe, Hg, Zn	RIHMI-WDC	Regularly sampled from the surface to 10 m depth	Eastern coast of Black Sea 2001-2007
Water column	Heavy metals	Mn, Fe, Cu, Zn, Cd, Pb, Hg, As	SIO-RAS branch SIO RAS	183 stations	north-eastern coast of Black Sea 2006-2008
Water column	Fertilisers	PO4-P, TP, NO3-N, NO2-N, NH4-N, TN	SIO-RAS branch SIO RAS	~7800 stations	Eastern coast of Black Sea 1999-2008

Water column	Organic matter	BOD5, oxydizability (Mn), organic N P, organic N	SIO-RAS	SIO RAS, Southern branch SIO RAS	~200 stations	Eastern coast of Black Sea	2006-2008	LS (SDN licence)	Monitoring program
Water column	Some of the classes	O2, H2S, pH, Total alkalinity, Si	SIO-RAS	SIO RAS, Southern branch SIO RAS	~7800 stations	Eastern coast of Black Sea	1999-2008	LS (SDN licence)	Monitoring program
Water column	Hydrocarbons including oil pollution		SIO-RAS	SIO RAS, Southern branch SIO RAS	183 stations	Eastern coast of Black Sea	2006-2008	LS (SDN licence)	Monitoring program
Water column	Contaminants	Detergents, Fenols, Suspended solids, TPHs	SIO-RAS	SIO RAS, Southern branch SIO RAS	183 stations	Eastern coast of Black Sea	2006-2008	LS (SDN licence)	Monitoring program
Sediment	Total PetroleumHydrocarbons (TPHs)		SIO-RAS	SIO RAS, Southern branch SIO RAS	58 stations	Black Sea	2007, 2008	LS (SDN licence)	Monitoring program
Sediment	Heavy metals	Mn, Fe, Cu, Zn, Cd, Pb, Hg, Ni, As	SIO-RAS	SIO RAS, Southern branch SIO RAS	58 stations	Black Sea	2007, 2008	LS (SDN licence)	Monitoring program
Water column	Radiotnclides	SR90, Cs137	MHI-DMIST	MHI-DMIST	50 profiles	Black Sea	2007-1995	academic	Scientific cruises
Water column	Fertilisers and other nitrogen- and phosphorus-rich substances	inorganic nutrients, total phosphorus and nitrogen	MHI-DMIST	MHI-DMIST	500 profiles	Black Sea	1970-1995	academic	Scientific cruises
Water column	Organic matter	Particulate organic nitrogen and carbon	MHI-DMIST	MHI-DMIST	50 profiles	Black Sea	1985-1995	academic	Scientific cruises
Sediment	Heavy metals	Mn, Fe	MHI-DMIST	MHI-DMIST	20 profiles	Black Sea	2001-2005	academic	Scientific cruises
Water column	Hydrocarbons including oil pollution	oil pollution	MHI-DMIST	MHI-DMIST	20 profiles	Black Sea	1975-1990	academic	Scientific cruises
Water column	Pesticides	DDT etc.	IO-BAS	Ministry of Environment and Waters	15 observation points	Western Black Sea; Rivers of the Black Sea Basin	from 1960 for rivers and from 1970 for Black Sea	RS	Permanent monitoring (usually once a month)
Water column	Heavy metals	Mn, Fe, Cu	IO-BAS	Ministry of Environment and Waters + IO-BAS	15 observation points	Western Black Sea; Rivers of the Black Sea Basin	from 1960 for rivers and from 1970 for Black Sea	RS	Permanent monitoring (usually once a month)
Water column	Fertilisers	PO4-P, TP, NO3-N, NO2-N, NH4-N, TN	IO-BAS	Ministry of Environment and Waters + IO-BAS	15 observation points	Western Black Sea; Rivers of the Black Sea Basin	from 1960 for rivers and from 1970 for Black Sea	RS	Permanent monitoring (usually once a month)
Water column	Organic matter	BOD5, oxydizability (Mn), organic P, organic N	IO-BAS	Ministry of Environment and Waters	15 observation points	Western Black Sea; Rivers of the Black Sea Basin	from 1960 for rivers and from 1970 for Black Sea	RS	Permanent monitoring (usually once a month)

Water column	Hydrocarbons including oil pollution		O-BAS	Maritime administration + MoEW			2005-2007	RS
Water column	Fertilisers	PO4-P(µM; 1%) NO3-N(µM; 5%) NO2-N(µM; 1%) NH4-N(µM; 5%)	data accuracy	NIMRD	NIMRD	1856 stations	Western Black Sea	1980-1995 monthly, seasonal UN No
Water column	Fertilisers	PO4-P(µM; 1%) NO3-N(µM; 5%) NO2-N(µM; 1%) NH4-N(µM; 5%)	data accuracy	NIMRD	NIMRD	573 stations	Western Black Sea	1996-2002 monthly, seasonal RS No
Water column	Fertilisers	PO4-P(µM; 5%) NO3-N(µM; 9%) method Incertitude NO2-N(µM; 8%) NH4-N(µM; 8%) PO4-P(µM; 5%) TP(µM)	method	NIMRD	NIMRD	190 stations	Western Black Sea	2003-2007 RS No
Water - surface	Fertilisers	NO3-N(µM; 9%) method Incertitude NO2-N(µM; 8%) NH4-N(µM; 8%) TN(mg/dm ³)	method	NIMRD	NIMRD	2x33 stations/year	Western Black Sea	from 2003 biannual RS
Water column	Pesticides	HCB, Lindane, Heptachlor, Aldrin, Dieldrin, Endrin, pp' DDE, pp' DDD, pp' DDT (ng/l; 30% incertitude)		NIMRD	NIMRD	2x33 stations/year	Western Black Sea	from 2003 biannual RS
Sediment	Pesticides	HCB, Lindane, Heptachlor, Aldrin, Dieldrin, Endrin, pp' DDE, pp' DDD, pp' DDT (ng/g dry sediment; 30% incertitude)		NIMRD	NIMRD	2x33 stations/year	Western Black Sea	from 2003 biannual RS
Water - surface	Heavy metals	Cu, Cd, Pb, Cr, Ni (ug/l; 25% incertitude)		NIMRD	NIMRD	2x33 stations/year	Western Black Sea	from 2000 biannual RS
Sediment	Heavy metals	Cu, Cd, Pb, Cr, Ni (ug/g dry sediment; 25% incertitude)		NIMRD	NIMRD	2x33 stations/year	Western Black Sea	from 2000 biannual RS

			National Marine Monitoring Programme				
Water - surface	Hydrocarbons including oil pollution	Naftalin, Acenaphthylene, Acenaphterene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzo(k)fluoranthene, Dibenzo(ah)anthracene, Benzo(ghi)perylene, Indeno(1.2.3 - cd)pyrene (ng/l; 30% incertitude)	NIMRD	2x33 stations/year	Western Black Sea from 2003 biannual	RS	
Sediment	Hydrocarbons including oil pollution	Naftalin, Acenaphthylene, Acenaphterene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzo(k)fluoranthene, Benzo(a)pyrene, Dibenzo(ah)anthracene, Benzo(ghi)perylene, Indeno(1.2.3 - cd)pyrene (ng/g dry sediment; 30% incertitude)	NIMRD	2x33 stations/year	Western Black Sea from 2003 biannual	RS	National Marine Monitoring Programme
Water column	Pesticides	DDT etc. (Mg/L)	TSU-DNA	Institute of Hydrometeorology	5 observation points	Easter part of Black Sea; Rivers of the Black Sea Basin. from 1970 biannual	LS (SDN_licence)
Water column	Heavy metals	Cu, Zn, Ni, Pl, Co, Cd, Mn (Mg/L)	TSU-DNA	Institute of Hydrometeorology	5 observation points	Eastern part of Black Sea from 1970 biannual	LS (SDN_licence)
Water column	Hydrocarbons including oil pollution	Tot. petroleum hydrocarbons (TPH) (Mg/L)	TSU-DNA	Institute of Hydrometeorology	5 observation points	Eastern part of Black Sea; Rivers of the Black Sea Basin from 1970 biannual	LS (SDN_licence)
Water column	Radionuclides	Sr 90;Cs 134/137/141;Be 7;Mn 54;[Zr 95+Nb 95] (BK/M3)	TSU-DNA	Institute of Hydrometeorology	7 observation points	Eastern part of Black Sea from 1970 biannual	1986- 1991(permanent); 1981 to 1991 LS (SDN_licence)
Water column	Fertilisers and other nitrogen- and phosphorus-rich substances,	NO ₂ ⁻ NO ₃ ⁻ NH ₃ NH ₄ ⁺ PO ₄ ³⁻ (Mg/L)	TSU-DNA	Institute of Hydrometeorology	5 observation points	Eastern part of Black Sea; Rivers of the Black Sea Basin from 1970 biannual	LS (SDN_licence)
Sediment	Heavy metals	Cu, Zn, Ni, Pb, Co	TSU-DNA	Institute of Hydrometeorology	5 observation points	Eastern part of Black Sea; Rivers of the Black Sea Basin 2006-2007	LS (SDN_licence)
						Within the project	

Sediment	Heavy metals	As, Al, Cd, Pb, Cu, Cr, Zn, Hg	TSU-DNA	GAMMA Ltd	90 stations	Eastern part of Black Sea	2005	OG (organisation)	Within the project
Water column	Fertilisers and other nitrogen- and phosphorus-rich substances.	NO ₂ , NH ₄ , PO ₄ , SiO ₂	TSU-DNA	GAMMA Ltd	75 stations	Eastern part of Black Sea	2000	OG (organisation)	Within the project
Water column	Heavy metals	Fe, Mn, Ni, Co, Cu, Zn, Pb, Sr,	TSU-DNA	GAMMA Ltd	12 stations	Eastern part of Black Sea	2001, 2006	OG (organisation)	Within the project
Water column	Hydrocarbons including oil pollution	Tot. petroleum hydrocarbons (TPH)	TSU-DNA	GAMMA Ltd	5 stations	Eastern part of Black Sea	2006	OG (organisation)	Within the project
Sediment	Organic pollutants	Lindane, Hexachlorobenzene, Heptachlor, Aldrin, Dieldrin, Endrin, PAHs, Acenaphthylene, Fluorene, Acenaphthene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benzo(a)anthracene	Black Sea states	BSC	min 200	Black Sea	2001-2007	MO (moratorium)	BSIMAP*
Sediment	Oil Pollution	Total Petroleum hydrocarbons	Black Sea states	BSC	min 1000	Black Sea	2001-2007	MO (moratorium)	BSIMAP*
Sediment	Trace metals	Cu, Cd, Pb, Ni, Cr, Li, Zn, Al, Ni	Black Sea states	BSC	min 200	Black Sea	2001-2007	MO (moratorium)	BSIMAP*
Water column	Organic pollutants	Pesticides (DDT, DDE, DDD), PAHs total, Phenols, Hexachlorobenzene, Heptachlor, Aldrin, Dieldrin, Endrin, Naphthalene, Acenaphthylene, Fluorene, Acenaphthene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benzo(a)anthracene	Black Sea states (basically Romania and Turkey)	BSC	min 200	Black Sea	2001-2007	MO (moratorium)	BSIMAP*
Water column	Trace metals	Cu, Cd, Pb, Ni, Cr	Black Sea states	BSC	min 200	Black Sea	2001-2007	MO (moratorium)	BSIMAP*

Biota (mussels)	Hidrocarburos polycyclic aromatic						
Biota (mussels)	heavy metals	Hg, Cd, Pb, Cu, Zn y As	IEO	IEO	12 stations (192 samples)	Balearic-Sea (1991-2006 annually	LI
Biota (mussels)	Persistent Toxic compounds	Polychlorinated biphenyls (PCBs) Chlorinated pesticides DDTs hexachlorocyclohexane Hexachlorobenzene Aldrin Dieldrin Endrin Isodrin Trans-nonachlor (TNONC)	IEO	IEO	12 stations (108 samples)	Balearic-Sea (1993-1995, 2000-2006), annually	LI
Water column	Fertilisers and other nitrogen- and phosphorus-rich substances	Nutrients, DIN, PO4, OGS	ICRAM as coordinator	12/12 stations	Northern Adriatic (38.05-45.07 N, 10.85-14.44 E)	seasonal from 1999 to 2002	Restricted
Water column	Organic matter	DOC, POC, TOC, TEP	ICRAM as coordinator	890 stations	Northern Adriatic (38.1-45.07 N, 10.88-14.44 E)	seasonal from 1999 to 2002	Restricted
Water column	Fertilisers and other nitrogen- and phosphorus-rich substances	Nutrients	OGS	grid of 11 stations sampled seasonally	Northern Adriatic (44.6-45.7 N, 12.3-13.5 E)	seasonal from 1999 to 2006	Restricted
Water column	Hydrocarbons including oil pollution	Mineral oils, Tensioactive substances, Fenoli	Regional Environmental Agency ARPA Veneto	93 stations	Control points in bathing waters close to potential contaminants sources	From 2000 (weekly during summer)	Restricted
Water column	Fertilisers and other nitrogen- and phosphorus-rich substances	Transparency, PH, Dissolved oxygen, Colou, TOTN, N-NH3, N-NO3, N-NO2, TOTP, P-PO4	Regional Environmental Agency ARPA Veneto	48 stations	8 transects perpendicular to the coast	From 2005 monthly (biweekly during summer)	Restricted
Sediments	Syntetic compounds	DDT, DDE, DDTOT, a-HCH, b-HCH, c-HCH, d-HCH, aldrin, dielein, HCB, 4-CL	Regional Environmental Agency ARPA Veneto	48 stations	8 transects perpendicular to the coast	From 2005 annual (March)	Restricted

Sediments	Heavy metals	Me, Cd, Cr, Pi, Zn, Cu, Va, As, Ni, Al, Fe	OGS	Regional Environmental Agency ARPA Veneto	48 stations	8 transects perpendicular to the coast	From 2005 annual (March)	Restricted	Regional monitoring program for marine coastal water
Biota (<i>Mytilus galloprovincialis</i>)	Synthetic compounds	DDT, DDE, DDTOT, a-HCH, b-HCH, c-HCH, d-HCH, aldrin, dieldrin, HCB, 4-CL	OGS	Regional Environmental Agency ARPA Veneto	48 stations	8 transects perpendicular to the coast	From 2005 annual (March)	Restricted	Regional monitoring program for marine coastal water
Biota (<i>Mytilus galloprovincialis</i>)	Heavy metals	Me, Cd, Cr, Pi, Zn, Cu, Va, As, Ni, Al, Fe, Ar	OGS	Regional Environmental Agency ARPA Veneto	48 stations	8 transects perpendicular to the coast	From 2005 annual (March)	Restricted	Regional monitoring program for marine coastal water
Water column	Hydrocarbons including oil pollution	Mineral oils, Tensioactive substances, Fenoli	OGS	Regional Environmental Agency ARPA Emilia-Romagna	91 stations	Control points in bathing waters close to potential contaminant sources	From 2002 (biweekly during summer)	Restricted	Regional monitoring program for bathing water quality
Water column	Fertilisers and other nitrogen- and phosphorus-rich substances	Transparency, pH, Dissolved oxygen, Colour, TOTN, N-NH3, N-NO3, N-NO2, TOTP, P-PO4	OGS	Regional Environmental Agency ARPA Emilia-Romagna	32 stations	8 transects perpendicular to the coast	From 2002 monthly (biweekly during summer)	Restricted	Regional monitoring program for marine coastal water
Sediments	Synthetic compounds	DDT, DDE, DDTOT, a-HCH, b-HCH, c-HCH, d-HCH, aldrin, dieldrin, HCB, 4-CL	OGS	Regional Environmental Agency ARPA Emilia-Romagna	32 stations	8 transects perpendicular to the coast	From 2002 annual	Restricted	Regional monitoring program for marine coastal water
Sediments	Heavy metals	Me, Cd, Cr, Pi, Zn, Cu, Va, As, Ni, Al, Fe	OGS	Regional Environmental Agency ARPA Emilia-Romagna	32 stations	8 transects perpendicular to the coast	From 2002 annual	Restricted	Regional monitoring program for marine coastal water
Biota (<i>Mytilus galloprovincialis</i>)	Synthetic compounds	DDT, DDE, DDTOT, a-HCH, b-HCH, c-HCH, d-HCH, aldrin, dieldrin, HCB, 4-CL	OGS	Regional Environmental Agency ARPA Emilia-Romagna	32 stations	8 transects perpendicular to the coast	From 2002 annual	Restricted	Regional monitoring program for marine coastal water
Biota (<i>Mytilus galloprovincialis</i>)	Heavy metals	Me, Cd, Cr, Pi, Zn, Cu, Va, As, Ni, Al, Fe, Ar	OGS	Regional Environmental Agency ARPA Emilia-Romagna	32 stations	8 transects perpendicular to the coast	From 2002 annual	Restricted	Regional monitoring program for marine coastal water
Eastern Mediterranean									
Sediment	Heavy metals	Zn, Cd, Pb, Cu, Ni, Mn, Fe, Cr	Univ. of Athens	90 samples	Saronikos Gulf	1985-2006	L	MEDPOL Saronikos Monitoring	
Sediment	Hydrocarbons including oil pollution		HCMR	45 samples	Saronikos Gulf	1998-2006	L	MEDPOL Saronikos Monitoring	
Sediment	Synthetic compounds	PAHs, DDTs, PCBs	HCMR	75 samples	Saronikos Gulf	1998-2006	L	MEDPOL Saronikos Monitoring	
Sediment	Heavy metals	Al, Ti, Fe, Cr, Mn, Co, Ni, Cu, Zn, As, Pb	HCMR	63 samples	Inner Saronikos Gulf	May 2001	L	MEDPOL Saronikos Monitoring	
Biota (Mussels, Fish)	Heavy metals	Zn, Cd, Pb, Cu, Ni, Mn, Fe, Cr	HCMR	1650 samples	Saronikos Gulf	1985-2006	L	MEDPOL Saronikos Monitoring	

Biota (Mussels, Fish)	Synthetic compounds	PAHs, DDTs, PCBs	HCMR	HCMR	120 samples	Saronikos Gulf	1985-2006	LI	MEDPOL Saronikos Monitoring
Water column	Heavy metals	Zn, Cd, Pb, Cu, Ni, Mn, Fe, Cr	HCMR	HCMR	240 samples	Saronikos Gulf	1992-2006	LI	MEDPOL Saronikos Monitoring
Water column	Fertilisers	PO4-P, TP, NO3-N, NO2-N, NH4-N, TN	HCMR	HCMR	3740 samples	Saronikos Gulf	1987-2006	LI	MEDPOL Saronikos Monitoring
Water column	Heavy metals	Al, Ti, Fe, Mn, Ni, Cu, Pb, Cd	HCMR	HCMR	250 samples	Inner Saronikos Gulf	May 2001	LI	MEDPOL Saronikos Monitoring
Water column	Organic matter	POC	HCMR	HCMR	361 stations	Saronikos Gulf	2000-2004	LI	
water column	Radionuclides	Cs 137	OC-UCY	Ministry of Environment	> 50 stations	NE Levantine Basin	Periodically	MO	No
water column	Fertilisers and other nitrogen- and phosphorus-rich substances	Nitrogen, Phosphorus	OC-UCY		> 50 stations	NE Levantine Basin	1996-2003	MO	No

ANNEX 2 TO THE CALL FOR TENDERS MARE/2008/03
"PREPARATORY ACTIONS FOR EUROPEAN MARINE OBSERVATION AND DATA NETWORK"

LOT NO: 3 – CHEMICAL DATA

FINANCIAL TENDER FORM

Company name Istituto Nazionale di Oceanografia e di Geofisica Sperimentale - OGS	Telephone +39 040 2140391
Address Borgo Grotta Gigante 42/C, 34010 Sgonico-Trieste (ITALY)	e-mail agiorgetti@ogs.trieste.it

Tenderers will quote a lump sum for the project.

The price must be a fixed amount, non revisable and including all costs.

Prices must be expressed in euros, not including VAT, and amounts must be quoted to two decimal places.

A. Development Costs Costs incurred for phases 1-3 of project (see section 2.4 of specifications)	€.....589000, 00
B. Maintenance Costs Costs incurred for phase 4 of project (see section 2.4 of specifications)	€.....110000, 00
TOTAL COST (A+B)	€.....699000, 00

3 OTT 2009

Stamp, date and signature of tenderer:

[Signature]
IL PRESIDENTE
Prof. Ignazio Marson
