

Central EMODnet Portal Process, design, development use-cases & services

EMODnet

1. Recap and updates from the entry portal since last meeting

Process: design document, feedback and follow up

2. Landing page
3. Entry portal requirements - development of uses cases
4. EMODnet webservice

EMODnet Portal:

Part 1 – Process

Trajectory & Timeline

- 23 November 2012:** A **meeting** was organised between the European Commission, the coordinators of the different EMODnet lots and the Flanders Marine Institute to discuss the design of the central EMODnet Portal.
- ✓ It was decided that a **draft design document** would be drafted by the Flanders Marine Institute as a discussion note and distributed amongst the EMODnet coordinators and presented to the MODEG group.

EMODnet

Trajectory & Timeline

07 March 2013:	Proposal presented and discussed at MODEG meeting
31 May 2013:	Feedback from all coordinators received
5 July 2013:	First draft of the Website presented to MODEG & DIKE

EMODnet

EMODnet

Design document central EMODnet portal

This document is the **design document for a central EMODnet portal** and describes the technical setup and main functionalities of the central EMODnet Portal. This document is **open for comments, suggestions and modifications**.

EMODnet

EMODnet

General Objective

The overall objective of the central EMODnet Portal is to **provide the user with an accessible and user friendly web interface providing access to the data products and links to the data that were used to compile these data products and are available in the different thematic portals.**

The central EMODnet Portal needs to have **high performance, providing fast access** to chemical, physical, geological, biological, habitat and bathymetric data products at sea basin scale, produced within the different EMODnet lots. The central EMODnet Portal will also **provide general information on all EMODnet projects, promoting the project as one integrated network.**

7

EMODnet

EMODnet

General Objective

In order to achieve this, we proposed to:

i) create and populate a website to disseminate the EMODnet, using also different social media.

ii) build a GIS-based web portal providing access to the different thematic data products and

iii) host a robust IT infrastructure to store the thematic data products (web services)

8

EMODnet

EMODnet

Feedback received

- ✓ EMODnet Geology
- ✓ EMODnet Seabed Habitats
- ✓ EMODnet Chemistry
- ✓ EMODnet Bathymetry
- ✓ EMODnet Physics
- ✓ EMODnet Biology

9

EMODnet

EMODnet

Feedback received

- ✓ Identify common use cases as a roadmap for developing the Portal. These use cases should be targeting different EMODnet end-users, highlighting the added value of common analysis amongst different thematic data products.
- ✓ It was highlighted that different existing thematic data product portals have different tools, should be maintained and cannot be replaced by one central portal
- ✓ There is a need for a strong central portal, which attracts more end-users to EMODnet and EMODnet portals (including the use of different social media...)
- ✓ The central Portal should give clear overview of available products
- ✓ The central portal webpage should include a section on different vocabularies used within the different thematic portals and should include a section on the data policies of EMODnet and its subcomponent data systems.

10

EMODnet

Feedback received

- ✓ The Central Portal should be user friendly.

- ✓ The central portals should include a section or a use case dealing with Coastal data

11

EMODnet

EMODnet Portal:

Part 2 – Landing page

EMODnet

Construction EMODnet Central Portal

EMODnet website: currently under development

- website will be set up and populated with information on the overall EMODnet initiative.
- The website will contain detailed information and links to the different thematic portals and will give an overview of the European Marine Observation and Data Network, and its partner institutes.
- The website will also make use of social media (Facebook, Twitter, LinkedIn) to announce news and disseminate information.
- The website will embed the Central EMODnet Portal and will be available from <http://www.emodnet.eu>. All web statistics will be monitored

13

EMODnet

The screenshot displays the EMODnet Central Portal website. The header includes the EMODnet logo, the European Marine Observation and Data Network name, and social media icons for Facebook, Twitter, and LinkedIn. A navigation menu lists: Data Portals, Data Products, Web Services, Sea Basin Checkpoints, Partners, About, and Secretariat.

The main content area features a introductory paragraph: "The European Marine Observation and Data Network (EMODnet) is a consortium of organisations within Europe that assembles marine data, data products and metadata from diverse sources in a uniform way. The main purpose of EMODnet is to unlock fragmented and hidden marine data resources and to make these available to individuals and organisations (public and private), and to facilitate investment in sustainable coastal and offshore activities through improved access to quality-assured, standardised and harmonised marine data. EMODnet is an initiative from the European Commission Directorate-General for Maritime Affairs and Fisheries (DG MARE) as part of the Marine Knowledge 2020 Strategy."

Below this, a text block states: "Presently, there are six sub-portals in operation that provide access to marine data from the following themes: hydrography, geology, physical parameters, chemistry, biology, and physical habitats. One further portal covering human activities is currently under construction."

The website is organized into a grid of thematic data portals, each with a representative image and a "Read more" link:

- Hydrography:** Data on bathymetry (water depth), coastlines, and geographical location of underwater features, wrecks.
- Geology:** Data on seabed substrate, sea-floor geology, coastal behaviour, geological events and probabilities, and minerals.
- Seabed Habitats:** Data on modified seabed habitats based on seabed substrate, energy, biological zone, and salinity.
- Chemistry:** Data on the concentrations of chemicals (pesticides, heavy metals, antibiotics) in water, sediments and biota.
- Biology:** Data on temporal and spatial distribution of species abundance and biomass from several taxa.
- Physical Parameters:** Data on salinity, temperature, waves, currents, sea-level, light attenuation, and FerryBoxes.
- Human Activities:** (Currently under construction)

The European Marine Observation and Data Network (EMODnet) is a consortium of organisations within Europe that assembles marine data from diverse sources in a uniform way. The main purpose of EMODnet is to unlock fragmented and scattered data and to make these available to individuals and organisations (public and private), and to facilitate marine data and offshore activities through improved access to quality-assured, standardised and harmonised data. EMODnet is a project funded by the European Commission Directorate-General for Maritime Affairs and Fisheries (DG MARE) under the EU 2010-2013 strategy.

EMODnet portals in operation that provide access to marine data from the following themes: hydrography, geology, chemistry, biology, and physical habitats. One further portal covering human activities is currently under development.

Hydrography

Data on bathymetry (water depth), coastlines, and geographical location of underwater features: wrecks.

ACCESS THE SEABED HABITATS PORTAL

Seabed Habitats

Objectives

The general objective of the EUSEaMap 2 project is to create a homogeneous seabed habitat map covering all European seas. The main component is to extend the EUNIS (European Nature Information System) broadscale seabed habitat map developed under the EUSEaMap project for the Preparatory action for EMODnet to cover all European basins, with enhanced validation, and to complement this with the collation of any survey habitat maps available from Member States, their translation into EUNIS, and their storage in an attractive portal designed to meet users' needs fully and effectively.

[see the specific Objectives](#)

Data Sources & Methodology

Classification

The prerequisite to embarking on work on any of the basins under consideration is to assess their suitability with regard to EUNIS classification. Experience has shown that as EUNIS was initially born in the North and Celtic Seas that are entirely maritime in character, its extension to other Atlantic basins could be achieved merely by adding a few local classes.

[read more](#)

Primary data and intermediate layers

The expansion of EUSEaMap to cover the remaining basins will be undertaken by mobilising data capture from various sources. There are various strands of work detailed as follows. Broad-scale map is about the collation of primary data layers. These primary data layers may either be used directly as model input, or to produce intermediate layers, as is the case with bathymetry, the derivatives of which can provide deep sea zone depth boundaries. The Project also intends to collate historic detailed habitat maps among the Partnership and priority habitats seagrass beds of Posidonia and Cymodocea.

[read more about the primary layers](#)

Broad-scale map

Broad-scale map is about the collation of primary data layers. These primary data layers may either be used directly as model input, or to produce intermediate layers, as is the case with bathymetry, the derivatives of which can provide deep sea zone depth boundaries. As has been stated earlier, for the broad-scale strand of work, the Project relies heavily on timely delivery by the other Lots, so keeping in close contact with all Lots and monitoring timelines is of paramount importance. However, data products from the other lots are still being developed, therefore, we propose relying on default solutions to ensure timely delivery of a preliminary version. Later, in Year 2

What is EMODnet?

Context

Rapid increases in human uses of marine resources and the impacts of climate change are making the European shelf and coastal seas more susceptible to natural hazards, more exposed to and threatened by pollution, and could potentially result in depletion of resources of economic importance to Member States. Conflicts between commerce, recreation, development, environmental protection, and the management of living resources are becoming increasingly contentious and politically charged. It is essential therefore that we overcome current limitations to rapidly monitor indicative parameters and provide predictions of change.

Progress will only be achieved if there is a shared understanding of the drivers of change, the pressures they create and the corresponding impacts on the environment and associated ecosystems, including people, their quality of life and economic well being. The sciences – physical, biological, chemical, economic and social – can help to unravel these elements, but only if the data required to describe and understand key processes and facts are accessible. Capable end-to-end systems are needed to acquire, process, manage and deliver the resulting information.

Some necessary data are available; they have been captured over many years. However, responsibility for collecting data in Europe's seas and oceans is shared between a fragmented patchwork of regional, national, public and private organisations for various purposes. As a result, many valuable datasets are inaccessible. These datasets must be unlocked and made easily accessible so that they can be used in new ways.

European Marine Observation and Data Network (EMODnet)

The concept of a European Marine Observation and Data Network (EMODnet) that would unlock fragmented and hidden marine data resources was first mooted in the 2006 Green Paper for maritime policy. EMODnet is a network of organisations supported by the EU's integrated maritime policy. These organisations work together to observe the sea, to render the marine data collected freely available and interoperable, to create seamless data layers across sea-basins and to distribute the data and data products through the internet.

A first set of preparatory actions was launched in 2009 to set up prototype data platforms. Six thematic assembly groups – for hydrography, geology, physics, chemistry, biology and physical habitats – brought together a network of 53 organisations. These were largely public bodies – hydrographic offices, geological surveys, oceanographic institutes – that already manage marine data themselves. They were supported by private companies with expertise in data processing and dissemination.

These groups constructed internet gateways to data archives managed by Member States and international organisations. From these six portals, public or private users of marine data can now not only access the standardized observations themselves, together with data quality indicators, but also data products such as sediment or physical habitat maps for entire sea basins. No restrictions have been imposed on access or use of these data products. The work builds on and reinforces the INSPIRE Directive, the Environmental Information Directive and the Directive on the re-use of public sector information. The Common Information Sharing Environment (CISE) will be able to import EMODnet data and so provide information to maritime authorities in environment, fisheries, transport, border control, customs, and general law enforcement as well as defence. The work was guided and monitored by an independent group of experts and an interim evaluation has confirmed the soundness of the approach. Accordingly, the work is being extended under the 2011 Regulation to support the Integrated Maritime Policy to cover all European sea basins. A thematic group on human activities will be set up to complement the other six. By 2014, the aim is to deliver a medium resolution mapping of European seas for these seven themes. The Regulation also supports prototype 'sea-basin checkpoints' for the first time. These are mechanisms to identify whether the present observation

Secretariat

An EMODnet Secretariat has been commissioned (tender MARE/2012/15) to provide high-level coordination and technical skills to support (i) the monitoring of EMODnet projects; (ii) the dissemination of their results; and (iii) the analysis of user feedback and statistics. The EMODnet Secretariat will also oversee the development of the EMODnet central portal as a common gateway to provide access to all seven thematic portals. The main aim is to develop a more effective, efficient and fit for purpose EMODnet.

The EMODnet Secretariat is provided by Seascope Consultants Ltd (www.seascopeconsultants.co.uk) **Jan-Bart Calewaert** (overall coordination and communication), **Liesbeth Renders** (technical support), **Phil Weaver** (project oversight) and **Vikki Gunn** (management support).

EMODnet

EMODnet Portal:

Part 3 – Use case

EMODnet

EMODnet

Possible Uses Cases

- Use Cases will be used as a roadmap for developing the Portal
- Highlight added value of bringing thematic data together
- Generate functional requirements of portal
- Possible link with seabasin checkpoints?
- Scientific – or user need driven
- Through working group with coordinators of the different lots and the Secretariat

23

EMODnet

EMODnet

Uses Case I

- Combined output from different data products: **Query EMODnet data products simultaneously**
- What it is: Retrieve data from multiple data products via one single interface
- In what context: For providing Fisheries Authorities with information relevant to perform fisheries assessments
- What the output will be The output is a list of values for a given coordinate point or list of points. For a given coordinate (e.g. current position of a vessel), the system will return a list of the required parameters (depth, seabed substrate, seabed habitat, mean temperature/salinity for a given time interval or depth, fishing zone, national jurisdiction, protected area etc).

24

EMODnet

 **EMODnet**

Uses Case I

- functionality will make use and integrate geographic webservices provided by the different thematic lots. It will provide the user with a tool that easily integrates the output from the different thematic products. The tool will be based upon OGC compliant webservices – and requires more specifically operational Web Feature Service (WFS) and Enhanced Web Map Service (WMS) that support the "GetFeatureInfo". Once the tool is operational, new OGC compliant data products, developed within the context of EMODnet can be added to this tool

25

EMODnet

 **EMODnet**

Use Case I: Query products simultaneously

Retrieve Data from specified coordinates at a given time or for a time interval

Physical Parameters (temperature, salinity)

Bathymetry

Seabed Substrate

Marine Region (ICES, Protected Area)

Species Abundance

Coordinate	Average Depth (m)	Seabed Substrate	Seabed Habitat	Cod mean abundance	Nitrates (5m -µmol/l)	ICES Statistical Area	EEZ
2,546 1 51,7 123	23,0	mud to sandy mud	Infralittoral mixed	0,37	16,1	XIb	French EEZ
3,746 1 54,7 123	27,4	mud	Circalittoral sandy	0,45	34,1	VIIa	Dutch EEZ
6,546 1 53,7 123	87,5	course-grained sedi	Circalittoral muddy	1,89	27,1	VIIb	Danish EEZ

EMODnet

Uses Case 2: Benthic Index Calculation (BEQI)

- **Run online calculations on EMODnet data products**

- **What it is** The Benthos Ecosystem Quality Index (BEQI) is a biological index that is used to assess the state of soft-sediment benthic habitats. The index can be calculated at ecosystem, habitat and community level and primarily aims at providing a signal that is capable of showing significant deviations from a defined reference state.

- **In what context** The Benthos Ecosystem Quality Index (BEQI) is a biological index that is used to report on the state of soft-sediment benthic habitats of marine, coastal and transitional waters for the Marine Strategy Framework Directive and the Water Framework Directive.

27

EMODnet

EMODnet

Uses Case 2: Benthic Index Calculation (BEQI)

- **What the output will be:** A tool providing the user the possibility to assess the state of ecosystems, habitats and communities for different European seabasins by comparing their data with an reference condition derived from observation data collected within EMODnet. The aim is to provide the possibility to assess the status of habitats at sea basin level.

- **What are the technical specifications:** Users will be able to run calculations on the data and data products produced by the different lots. The BEQI index will be used as an example, but the functional developments can be reused to calculate other indices on EMODnet data and data products as a lot of different member states defined those type of indices under the MSFD and WFD.

28

EMODnet

 **EMODnet**

Use Case II: Run online calculations on EMODnet data products

Seabed Substrate
Biological Zones
Energy
Salinity
Light
Bathymetry

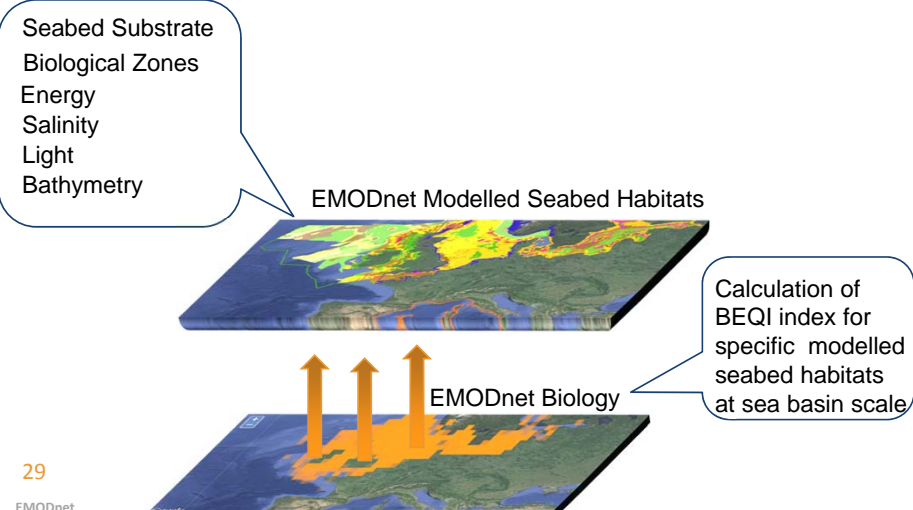

EMODnet Modelled Seabed Habitats

EMODnet Biology

Calculation of BEQI index for specific modelled seabed habitats at sea basin scale

29

EMODnet

 **EMODnet**

Uses Case 3: Coastal data

- Implement spatial filters on data products
- What it is: The EMODnet Central Portal will allow the user to browse and select for coastal data processed by different thematic lots. This will require the possibility to browse for data measured along the national baseline or coastline.
- In what context: A key challenge for good implementation of Coastal Management Plans is the availability and accessibility of good quality coastal data. The terms of reference of the thematic EMODnet projects highlight in this context the importance to focus also on specific coastal data.

30

EMODnet

EMODnet

Uses Case 3: Coastal data

- What the output will be: Specific coastal dataproducts will be developed under phase 2: rates of sedimentation and erosion, coastal typology, high resolution bathymetry. The central portal should be able to combine these dataproducts, and provide the functionality to select these data, as measured from a distance from the national baseline or coastline
- How to implement this – what the functionalities will be: This functionality will allow to perform complex spatial queries on dataproducts. Essential for this is to implement spatial indexes on the EMODnet dataproducts.

31

EMODnet

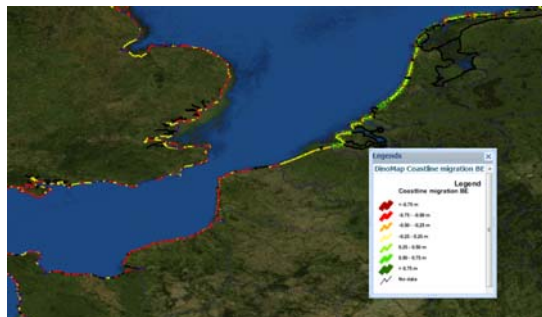

EMODnet

Use Case II: Coastal data

supporting the assessment of coastal status and trends

- EEA European coastline
- EMODnet Bathymetry (depth)
- EMODnet Geology
 - Coastline Migration, Sediment Accumulation rate, Seabed Substrate
- EMODnet Physics
 - Tides, Waves, wind
- Marine regions

32

EMODnet

EMODnet Portal:

Part 4 – EMODnet webservice

EMODnet

Web Map Service (WMS)

- The OpenGIS® Web Map Service Interface Standard (WMS) provides a simple HTTP interface for requesting geo-registered map images from one or more distributed geospatial databases.
- A WMS request defines the geographic layer(s) and area of interest to be processed. The response to the request is one or more geo-registered map images (returned as JPEG, PNG, etc) that can be displayed in a browser application.
- The interface also supports the ability to specify whether the returned images should be transparent so that layers from multiple servers can be combined or not.

**EMODnet**

Web Map Service & Web Feature Service Operations

■ GetCapabilities

to obtain service metadata, which is a machine-readable (and human-readable) description of the server's information content and acceptable request parameter values.

■ GetMap

The GetMap operation returns a map. Upon receiving a GetMap request, a WMS shall either satisfy the request or issue a service exception.

**EMODnet**

Web Map Service vs Web Feature Service

■ GetFeatureInfo (Web Map Service)

The GetFeatureInfo operation is designed to provide clients of a WMS with more information about features in the pictures of maps that were returned by previous Map requests. The canonical use case for GetFeatureInfo is that a user sees the response of a Map request and chooses a point (I,J) on that map for which to obtain more information.

■ GetFeature (Web Feature Service)

A web feature service must be able to service a request to retrieve feature instances. In addition, the client should be able to specify which feature properties to fetch and should be able to constrain the query spatially and non-spatially.

Web Map Service vs Web Feature Service

Example of an output of a **WMS** from Biology
 GetFeatureInfo – Layer is queryable
 Output is a list of all data defined in the WMS for the considered area– C6

Annual mean abundance of North Atlantic/North Sea CPR standard areas for dinoflagellates 1958-2006			
	Attributes		
Properties	CPR Area	Year	Annual mean abundance (individuals/3m ³)
	C6	1963	15472.9904296
	C6	1964	2538.02910053
	C6	1967	7285.61145957
	C6	1992	24656.8039798
	C6	1993	103121.761241

Web Map Service vs Web Feature Service

Example of an output of an hypothetical **WFS** from Biology
 GetFeature – Layer is queryable and Data are queryable
 Output is a value per coordinate point.
 EMODnet Central Portal is able to: **1.** define what attributes to receive **2.** define a filter
 These properties are only possible using **WFS!**

Annual mean abundance of North Atlantic/North Sea CPR standard areas for dinoflagellates 1958-2006			
	Attributes		
Entries	CPR Area	Year	Annual mean abundance (individuals/3m ³)
	C6	1963	
	C6	1964	
	C6	1992	
	C6	1993

EMODnet

EMODnet Central Portal

- Be able to get access to the data via WFS (GetFeature)
- Perform queries over WFS
- Return output in different formats (list of features per coordinate point, list of points or area, Indexes etc.)

EMODnet

Multiple Servers = Multiple Requests

- EMODnet central portal will need to set up a data base with all the URLs for each of the web service. OR
- All the Lots adopt the same server type and use the same attributes

All the web services must provide data per coordinate point.

URL Structure	Description
http://host[:port]/path?{name}=value&{}	URL prefix of service operation. [] denotes 0 or 1 occurrence of an optional part; {} denotes 0 or more occurrences.
name=value&	One or more standard request parameter name/value pairs as defined for each operation by this International Standard.

id	name	type	url	mapfile	layer	thema	thema_english	imisdasID	description	source	filter	style

EMODnet

Minimum data requirements for the Web Services

	Data (attributes) per Coordinate point
Hydrography	Latitude, Longitude, value (depth)
Geology	Latitude, Longitude, value (seabed substrate, lithology, sediment accumulation rate, stratigraphy, etc.)
Chemistry	Latitude, longitude, value (concentration), date, depth,
Seabed habitats	Latitude, Longitude, value (seabed habitat)
Biology	Latitude, longitude, value (abundance, biomass), species, date
Physics	Latitude, longitude, value (temperature, salinity), depth, date,

EMODnet

Towards operationality of web services

- OCG testing facility
- Rating system similar to OneGeology (aiming at 4* rating)

Star Rating	Level of service attained	Technical and service parameters to be met
One star	Basic Web Map Service (WMS)	Web Map Service (WMS) supporting "GetCapabilities" and "GetMap" requests to deliver map images.
Two star	Upgraded Web Map Service (WMS)	<ul style="list-style-type: none"> • One Star requirements met. • Map legend provided. • Minimum metadata available (contact information, abstract, access constraints, cataloguing keywords).
Three star	Enhanced Web Map Service (WMS)	<ul style="list-style-type: none"> • Two Star requirements met. • "GetFeatureInfo" (at least text/html format) request supported. • Web Map Service (WMS) v. 1.3.0 supported. • Clear statement of use relating to data, including license and charging details (where appropriate). • Access to data must be transparent, simple and fair to all.
Four star	Web Feature Service (WFS)	<ul style="list-style-type: none"> • Three Star requirements met. • "MetadataURL" for each WMS layer and WFS feature type should point to a metadata record conforming at least to the metadata profile. • Web Feature Service (WFS) at a minimum v. 1.1.0. • Filter Property

EMODnet

Provisional Rating

Lot	Rating	Problem description
Hydrography		Legend available but irrelevant, GetfeatureInfo returns colour instead of depth
Geology		Metadata link, no WFS capabilities
Chemistry		Under development
Seabed habitats		Some layers do not support GetFeatureInfo
Biology		Metadata link, no WFS capabilities
Physics		No Legend, only data available is the Stations Names
